                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments
vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzhaimer's disease and achizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disgnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= a

Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically informulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present
to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /*tore b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified decoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation.

They are useful for selectively preventing gene expression in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridiaing to complementary RNA such as cellular RNA or viral RNA, to hybridiaing to complementary RNA. They are also useful therspeutically in formulations or medicaments to prevent or traget RNA. They are also useful therspeutically in formulations or medicaments to prevent target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "Bases 12 and 13 are linked by a butanediol linker which is represented as B in page 49 and Fig 5 and as X in page 55 and Fig 6 of the specification"
sequence is an antisense oligo used to elicit human RNase (ribonuclease)
H degradation of target RNA. This sequence is used in the exemplification
of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel acyclic linker-containing oligonucleotide useful for preventing decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.

Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridising to complementary RNA such as cellular RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel acyclic linker-containing oligonuclectide useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2'F-ANA antisense oligo #2, to elicit RNase H degradation of target RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /*tag= b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular MRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9. .10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antiboddes (Ab) against the polypeptide are useful for prevention and/or treatment of tumours or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and or prognession of the nucleotides and polypeptides can be used for diagnosis and or prognession of the nucleotides and polypeptides can be used for diagnosis.

```
New nucleic acid sequences associated with tumor suppression, regression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents an isolated nucleic acid sequence associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     엄
                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
or a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (FTGDR),
[KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
on nervous system (CKS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or gliona), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), orbon's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cxpression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to amplifying for RNA in a sample comprises eliminating single-stranded oligonucleotide from the transcription sample. The method involves synthesizing single-stranded cDNA by incubating the sample RNA with reverse transcriptase and an oligonucleotide primer that primes synthesis in a direction toward 5 end of the RNA; converting the single-stranded cDNA into double-stranded cDNA to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription from a polymucleotide template. The method inhibits the undesired non-femplate derived production of RNA in the transcription reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amplifying for RNA in a sample, useful for improving RNA polymerase based RNA transcription from a polynucleotide template, comprises eliminating single-stranded oligonucleotide from the transcription sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Intramolecular base pair; intermolecular base pair; unstructured nucleic acid; UNA; molecular biology; nucleic acid chemistry; polymerse extension reaction; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                               ö
                                                                                                                                          The present invention provides a system for the production of nucleic acids with reduced levels of intramolecular base pairing (secondary structured) and intermolecular base pairing by generating unstructured nucleic acids (UNAs). The invention is useful for generating nucleic acid having a reduced ability to hybridise. The invention is also useful in molecular biology and nucleic acid chemistry. The present sequence is an annealing primer used to generate single-stranded labelled unstructured nucleic acid (UNA) by polymerase extension reaction (PCR). This sequence is used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunostimulatory oligonucleotide; immune response; allergy; asthma;
                                                                                Generating nucleic acid having reduced ability to hybridize for use in molecular biology, comprises providing nucleotide triphosphates to synthesize nucleic acid complementary to a template nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         viral infection; bacterial infection; cancer; lymphoma;

                                                                                                                                                                                                                          The invention relates to a class of CpG immunostimulatory oligonucleotides containing a S'TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, breast cancer, cervical cancer, choriocarcinoma, colon cancer, andomerial cancer, partial cancer, lymphomas, intraepithehial neoplasma, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, panoreatic cancer, prostate cancer, rectal cancer, connective tissue cancer, renal cancer, bone cancer, brain and CNS cancer, connective tissue cancer, resophageal cancer, by Hodgkin's lymphoma, larynx cancer, or sosophageal cancer, eye cancer, Hodgkin's lymphoma, larynx cancer, or cosophageal cancer, as well as other carcinomas and sarcomas. The invention is also useful in gene therapy. The present sequence is a CpG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CpG immunostimulatory oligonuclectide; immune response; allergy; asthma; viral infection; bacterial infection; cancer; lymphoma; intraepithelial neoplasm; melanoma; neuroblastoma; Hodgkin's lymphoma; carcinoma; sarcoma; gene therapy; phosphorothioate; ss.
New oligonucleotides, useful for treating allergy or asthma, viral and bacterial infections, and cancer, e.g. biliary tract cancer, breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a class of CpG immunostimulatory
oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that
are useful for stimulating an immune response. Oligonucleotides and
compositions of the invention are useful for treating allergy or asthma,
viral and bacterial infections and cancer e.g. biliary tract cancer,
breast cancer, cervical cancer, choriocarcinoma, colon cancer,
condomerrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms,
liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma,
cutroblastomas, ovarian cancer, pancreatic cancer, prostate cancer,
rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer,
cetal cancer, connective tissue cancer, osesophageal cancer, brain
and CNS cancer, connective tissue cancer, osesophageal cancer, ere
chodykin's lymphoma, larynx cancer, oral cavity cancer, skin cancer,
testicular cancer, as well as other carcinomas and sarcomas. The
invention is also useful in gene therapy. The present sequence is a CpG
immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fires a hosphorylated poly dT, which binds to a bridging oligonucleotide"
New oligonucleotides, useful for treating allergy or asthma, viral and bacterial infections, and cancer, e.g. biliary tract cancer, breast
                                                                                                                                                                                                                                                                                                                                                                                           0.6%; Score 17; DB 1; Length 17; 100.0%; Pred. The invention relates to a method for determining the presence of at least one specific nucleotide sequence in a target nucleic acid extracted from a biological sample comprises preparing a primer oligonucleotide comprising a first bridging sequence with a primer portion composed of a terminating and group attached to one end of the first bridging sequence and a terminating end group attached to the other end. The methods and compositions of the present invention are useful for assaying the presence of specific nucleic acids sequences, particularly for hybridizing nucleic acids in solutions or on surfaces like microarrays, and their amplification using RNA polymerase. The present sequence represents a poly dT primer, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                       Assaying the presence of specific nucleic acids sequences using primer oligonucleotides having a first bridging sequence with a primer portion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pharmaceutical; therapeutic; immune stimulation; immune response; allergy; asthma; autoimmune disease; antiasthmatic; antiallergic; immunosuppressive; phosphorothioate; ss.

C directeotide, and nt and nt and nt are polymucleotides that do not include directed, where NI does not include 5' Z nucleotide, and where a 3' polymucleotide consisting of the YZ dinucleotide and the NO shall be polymucleotide consisting of the YZ dinucleotide and where a 3' polymucleotide consisting a number of nucleotides in the oligonucleotide; and at most 45¢ of the number of nucleotides in the oligonucleotide; and and if a denotes the 3' can do fet he oligonucleotide, and where X is a T or modified T nucleotide, YI is a T or modified G nucleotide, where NI does not include a C or modified of 5-10 nucleotides, where NI does not include a C dinucleotide of 5-10 nucleotides, where NI does not include a C dinucleotide of 5-10 nucleotides. Also described are: (1) a polymucleotide of 5-10 nucleotides. Also described are: (1) a c polymucleotide of 5-10 nucleotides. Also described are: (1) a c polymucleotide of 5-10 nucleotides. Also described are: (1) a c method of pectifically increasing interleutin (IL)-10 expression in the atherapeutic agents, monoclonal antibodies, and anticancer agents; radiotherapeutic agents, monoclonal antibodies, and anticancer agents; c relative to interferon (IRN)-alpha expression in a subject. compression (IRN)-apha expression in a subject composition to the subject of inducing an antigen. Also method of inducing an antigen and administering an immunostimulatory nucleic acid or composition is administering an immunost
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or reduce an antigenspecific response to the implant in the subject. The oligonucleotide includes at least I modified internucleotide linkage such as a phosphorothioate linkage. The oligonucleotide, methods and compositions of the invention are useful for treating allergies, asthma, autoimmune diseases, arthritis, systemic lupus erythemarosus, multiple solerosis, crohn's disease, Type I diabetes mellitus, myasthenia gravis, autoimmune neuropathies such as Guillain-Barre, autoimmune uvaitis, autoimmune hemolytic anemia, pernicious anemia, autoimmune thrombocytopenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polymyositis, dermatomyositis, spondyloarthropathies such as ankylosing spondylitis, and Sjogren's syndrome. The autoimmune disease is caused by an infection e.g. Lyme disease. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hashimoto's thyroiditis, autoimmune oophoritis and orchitis, autoimmune disease of the adrenal gland, rheumatoid arthritis, scleroderma,
                                                                                                                 XYNIYZN2 3' where 5' denotes the 5' end of the oligonucleotide and 3' denotes the 3' end of the oligonucleotide, where X is a T or modified T nucleotide, Y is a C or modified C nucleotide, Z is a G or modified G nucleotide, and NI and N2 are polymucleotides that do not include a CG nucleotide, and NI and N2 are polymucleotides that do not include a CG
                                                                                     invention relates to an oligonucleotide having the formula: (a) 5'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      temporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculitis such as Wegener's granulomatosis, villigo, Crob Disease, ulcerative colitis, primary biliary cirrhosis, autoimmune hepatitis, immune-mediated diabetes mellitus, Grave's Disease,

Novel 18S ribosome RNA gene derived from common marmoset, or its partial fragment, useful as internal standard for measuring difference in expression level of gene of interest in two or more types of test 18s ribosomal RNA; 18s rRNA; RNA detection; DNA detection; expression; Common marmoset 18S ribosome PCR primer SEQ ID NO:4. AEF82502 standard; DNA; 17 BP 09-JUL-2004; 2004JP-00202891. 04-MAR-2005; 2005JP-00060329. CO LTD 20-APR-2006 (first entry) (SUMO ) SUMITOMO CHEM WPI; 2006-150097/16. Yamada T, Oeda K; ss; PCR; primer. JP2006042804-A. 16-FEB-2006. Synthetic. AEF82502; 

The invention relates to a novel 18S ribosome RNA gene (I) derived from a common marmoset, or its partial fragment (AEF82499). Also claimed is a composition for detecting DNA or RNA, comprising the 18S rRNA gene. The 18S rRNA gene is useful as an internal standard or a reference of the expression level of agene in the test sample during the measurement of the difference in the expression level of a gene of interest in two or more types of test sample, based on the difference in the transcription product amount of the gene, where the test sample is derived from a common marmoset. The transcription product amount of the gene of interest PCR. The present sequence represents a PCR primer used in the invention to synthesise 18S rRNA cDNA. transcriptaseis measured using a DNA array or by quantitative reverse Disclosure; SEQ ID NO 4; 21pp; Japanese.

                                                                                                                                                                                                                    Anchored poly(T) oligonucleotides polyT-anchA (AAT94667), polyT-anchC (AAT94668) and polyT-anchG (AAT94669) are complementary to the upstream region of a polyadenylation sequence. They were used to prime CDNA synthesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 sequences (see also AAT94670-73). A cDNA clone (see AAT94657) encoding flavonoid 3' hydroxylase (see AAN95704) was isolated using a differential display approach. This can be used to manipulate the pigmentation of
Flavonoid 3' hydroxylase; pigmentation; flower colour; transgenic plant; snapdragon; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Flavonoid 3' hydroxylase; pigmentation; flower colour; transgenic plant;
                                                                                                                                                                          Novel flavonoid 3'-hydroxylase(s) from flowering plants - and corresponding DNA, used in the manipulation of pigmentation in plants.
                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                         (AAT94668) and polyT-anchG (AAT94669) are complementary to the upstream region of a polytaderylation sequence. They were used to prime cDNA synthesis from snapdragon (Antirrhinum majus) petal and leaf RNA, and were also utilised in the PCR amplification of plant cytochrome P450 were slso utilised in the PCR amplification of plant cytochrome P450 aguences (see also AAT94670-73). A cDNA clone (see AAT94657) encoding flavonoid 3' hydroxylase (see AAN95704) was isolated using a differential display approach. This can be used to manipulate the pigmentation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel apoptosis-related DNAs and proteins - for diagnosis, preventing or treating diseases associated with apoptosis.
Novel flavonoid 3'-hydroxylase(s) from flowering plants - and corresponding DNA, used in the manipulation of pigmentation in plants.
                                                                                                                                                                         poly(T) oligonucleotides polyT-anchA (AAT94667), polyT-anchC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes novel proteins isolated from cDNA clones. AE648 11; AE693 11; AK438 11; AK609 11; AM1060 11; AQ2 11; K433 11; or 1256 11, deposited as ATCC 98237. The present sequence represents the 3'-portion of AQ2 11 isolated from a human ovary cDNA library. The proteins from the present invention may be administered in a composition to prevent, treat or ameliorate a medical condition. The proteins may exhibit biological activities such as nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth haemostatic and thrombotic activity, chemicaticiferentiation activity, haematory activity, cadherin/tumour invasion suppressor activity, until inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity and other activities. The invention relates to an analytical method for determining the nucleotide sequence of nucleic acid analytes, including chemically nucleotide sequence of nucleic acid analytes, including chemically modified oligonucleotides. This new method utilises electrospray constants. The ions are excited by sustained off-resonance excitation with single shot excitation, and the target fragmented by collisionally activated dissociation by a neutral cast, e.g. carbon dioxide. Alternatively, the excitation and dissociation can be nozale skimmer dissociation. The method is used in molecular biology and biomedical applications. The method is used in molecular can be nozale skimmer dissociations. The method, utilising electrospray is extremely rapid and acts directly on the oligonucleotide. The method is effective for a variety of nucleic acid analytes, particularly successfully sequenced. The present sequence represents a successfully sequenced. The present sequence represents a proposition of the present sequence represents and successfully sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta a N3'; or (X)m5'-(gamma)** (A) the sequence of a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine, or cytosine; N = adenine, guanine or thymine; and a thymine; amount a thymine; amount a thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides having at least two new nucleotides - useful as primers in RT-

sednences

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta a N3', or (X)m5'-(gamma) K-delta-N3'; where X = a labelled compound and/or nucleotide with voluntary sequence; m = 0 or 1; alpha = thywine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, quanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, quanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene

and viral diseases.

This invention describes novel secreted human proteins (I) which have cytostatic, immunostimulatory, antimicrobial, antiviral, immunosuppressive, antimilammatory and vulnerary activity and which act as cytokine, cell proliferation or differentiation regulators. (I) is useful for treating tumors, autoimmune diseases, inflammatory disorders,

Peptides having at least two new nucleotides - useful as primers in RT-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperunicemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAX97598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
wounds, microbial infections and viral diseases. (I) is also useful for suppressing graft versus host reaction. AAA40490-A40580 represent cDNA fragments that encode the secreted proteins AAB10226-B10288 described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                             A physiologically active protein specifically derived from mammal tissue

The invention relates to methods and kits for amplification of mRNA using a primer in PCR that contains an RNA polymerase (RNAP) promoter. The invention provides methods for amplification and detection of RNA derived from a population of cells, preferably eukaryotic cells and most preferably mammalian cells, which methods preserve fidelity with respect to sequence and transcript representation and additionally enable amplification of extremely small amounts of mRNA. The method and kit are useful for amplifying and detecting RNA derived from a population of cells, especially eukaryotic cells like mammals. The RNAS generated are useful for profiling gene expression in different populations of cells. The present sequence is a mRNA fragment used in 3' end PCR/IVT (in vitro
                                                                      88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Preparing transformed monocotyledon rice, with t-DNA tagging vector comprising enhancer element for activation tagging and reporter gene for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                 monocotyledons. The present sequence represents a Monocotyledon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                         ;

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating comprising oligonuclectides, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configuration or thyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regularing expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thy wildines present in the target RNA serves to prevent the breakdom of the oligonuclectides into products that free adenosine into the system content of the adenosine content of the adenosine content of the adenosine content of the adenosine content of the endiance adenosine content of the endiance adenosine of the content of the target RNA se
respiratory distress syndrome, allergic rhinitis, pulmonary hypertension, emphysema; chronic obstructive pulmonary disease, cancer, bronchitis; pulmonary transplantation rejection, ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oligonucleotide containing less percentage of adenosine, targeted uncleic acids associated with lung airway or lung dysfunction, and

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

expression - by amplification of mRNA followed

by digestion with restriction enzymes. Disclosure; Page 5; 11pp; Japanese.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEC files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amplification of mRNA followed
                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)

                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                   The invention relates to performing a thermal cycle of PCR by using a substrate on which a deoxyribonucleic acid (DNA) is immobilized. The method is useful in the medical, biochemical, molecular biological and genetic engineering fields. Sequences ABQ79871-881 represent PCR primers used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to diagnosis of hepatitis B virus (HBV) infection stages comprising identification of full length HBV transcripts (I) and truncated HBV transcripts (II) in a serum sample, where the ratio of I:II is indicative of a particular infection stage. The method is useful for diagnosing HBV infection stages and determining the risk for developing hepatocellular carcinoma. The present sequence is that of a HBV diagnostic PCR primer, useful for the invention
                                                                (PCR) by using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing hepatitis B virus (HBV) infection stages and determining the risk for hepatocellular carcinoma, comprises identifying full length HBV transcripts and truncated HBV transcripts in a serum sample.
                                                         Carrying out a thermal cycle of polymerase chain reaction (PCR) by using a substrate on which a DNA is immobilized used in medical, biochemical, molecular biological and gene engineering fields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hepatitis B virus; HBV; infection; hepatocellular carcinoma; diagnosis;

intiation retained to a plantameterial composition, which it is active agent comprising an oligimaterial composition, which is active agent comprising a polymentation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 6' or 3' end genomic flanking regions, 6' or 3' end genomic flanking regions, 6' or antialized an encoding a polymeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an ential flammatory second active agent composition of the invention thas antialized and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or arespiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intran-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention thas antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gene therapy. The composition may have a cuse in antisense gratery and alignant corposition may have a crowenting a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entiinflammatory steroid in a subject, for reducing or depleting levels of ceceptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject is tissue, or treating bronchoconstriction, clung surfactant in a subject is tissue, or treating bronchoconstriction, or ung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed presented in the printed and the control of the co

first active agent comprising an oligomorelectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction as decond active agent comprising an entilnflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entilnflammatory steroid in a subject, for reducing levels of contition, also of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or ung surfactent in a subject's tissue, or treating bronchoconstriction, lung surfactent in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allerajes, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed of the first into int, which was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                         Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel pharmaceutical composition, which has

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regaion, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antiasnes gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating conditions. Trespiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cauteding adenosine sensitivity, levels of adenosine (A) or (A) receptors, collgonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antialflammatory, antiatementic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung or with a disease or condition also are associated condition and and proportion, and and an and an appropriate condition as applicant pression and an application.
                                                                                                                                                                                                                                                                                                                                                                                  respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary

The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition
             transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antialflammatory; antiasthmatic; analgesic; hypotensive; immunosupptessive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distresses syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.

of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrencegic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered corposition comprises oligo and is administered to reduce the production composition comprises oligo and is administered to reduce the production of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung of inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, cinflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary disease, pulmonary cinflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

This invention describes a novel composition (a) a first active agent, comprising oligonuclecides, effective for alleviating bronchoonstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung or inflammation, allergies and/or surfactant hypoproduction are associated with a allergies and/or surfactant hypoproduction are associated with a allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, pulmonary transmation, allergies, asthma, impeded respiration; pulmonary transmation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary impeded respiration; pulmonary transmation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary incertions and represent in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine content of the anti-sommer and the prevent. In the print, heart, kidney envised to prevent the prevent. e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

Human glucocorticoid receptor-specific antisense oligonucleotide #4243.

antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; fumour formation; diabetes; obssity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2 -methoxyethyl; 2 -MOE.

New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

Claim 4; SEQ ID NO 4243; 985pp; English

to nucleic acids encoding a mammalian glucocorticoid receptor. The antiennes oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence repersents an antisense oligonucleotide that targets the human glucocorticoid receptor gene NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone. The invention comprises an antisense oligonucleotides that are targeted

New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

Claim 4; SEQ ID NO 2457; 417pp; English.

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound appecifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to encropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate

headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA. 8888888888

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEC files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                             gene expression; reverse transcription; primer; cDNA; restriction enzyme; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Reverse transcription primer used in cDNA analysis technique.
                                                                                             Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.6%; Score 17; DB 1; Length 21;

- by amplification of mRNA followed
                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ7547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abablled reverse transcription primers (GENESEQ files AAQ7547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis; gene expression; reverse transcription; primer; cDNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENGSEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                          - by amplification of mRNA followed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                   Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ7547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of

      - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                   Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       amplification of mRNA followed
                                                                                                                                                            gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ene expression; reverse transcription; primer; cDNA; restriction enzyme; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.6%; Score 17; DB 1; Length 21;

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                            of of
             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abablled reverse transcription primers (GENESEQ files AAQ75547-Q7578) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. ```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                      - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Use of mixed lineage kinase family kinase inhibitor in the manufacture of a medicament for treatment of asthma associated at-risk haplotype for asthma, at-risk haplotype in MAP3K9 gene or increased MLK1 protein expression or activity.

```
The invention relates to the moved use or a mixed inheade Kinase (Mikk) associated with a risk factor selected from an at-risk haplotype for associated with a risk factor selected from an at-risk haplotype for asthmatic asthmatic and the protect of a mixed in MAPIX9 gene, polymorphism in MAPIX9 nucleic acid, dysregulation of a MAPIX9 mRNA expression, dysregulation of a MAPIX9 mRNA september or identification of a mean of turber comprises a method for the diagnosis or identification of a mean of a method for the diagnosis or identification of a mean of a method for the use of a first nucleic acid molecule in a method for assessing the response to treatment with an MIX ample; a method for assessing the response to treatment with an MIX ample; a method for assessing the response to treatment with an MIX ample; a method for assessing the response to treatment with an MIX ample; and increased MIX1 brotein actid, dysregulation of in an individual with an at-risk haplotype for asthma, as above; a kit for MAPIX9 mRNA expression, increased MIX1 blochemical activity or increased transpared mixed protein isoform expression; a method for assessing the response to treatment with an MIX41 inhibitor in a target population including an individual with an at-risk haplotype for asthma, as above; a kit for assaying a sample for the presence of at least one nucleic acid capable of detecting the presence of at least one nucleic acid capable of detecting the presence of at least one mucleic acid capable of detecting the presence of at least one mucleic acid capable of detecting at least one haplotype comprising 2 or more alleles comprising; at least one mucleic acid capable of detecting at least one haplotype or assaying a sample for the presence of at least one haplotype or assaying a sample for the presence of at least one mucleic acid capable of detecting at least one mucleic acid capable of detecting at least one mucleic acid capable of detecting at least one mucleic acid approximate and reagents for detecting at least one mucle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       susceptibility to asthma. The inhibitor is also useful for the treatment of other respiratory diseases associated with MAP3K9 or other members of the JNK pathway such as chronic obstructive pulmonary disease, chronic bronchitis and other inflammatory diseases such as rheumatoid arthritis, psoriasis, multiple sclerosis and inflammatory bowel disease. This polynucleotide sequence represents a reverse primer which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MLK1 protein isoform expression; and in diagnosis or identification of
                                                                             The invention relates to the novel use of a mixed lineage kinase (MLK)

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, aslpiniquis, perihepatitis, bartholinitis, pneumogathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analyzing target nucleic acid sequences, useful for population genetics,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting infection or contamination by Paracoccidioides - using specific primers for nucleic acid amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT38294-303 are primers specific for an unique Paracoccidioides brasiliensis sequence. The unique sequence is contained in a 110 bp fragment (AAT38293) which includes 48 nucleotides of rat beta-actin primer sequence and 62 bp of unique P. brasiliensis sequence. The unique sequence can be used as a target for detection of Paracoccidioides infection. The specific primers are used to detect P. brasiliensis infection in mammals (and to monitor treatment) or contamination of food, water, soil, manufactured products (e.g. pharmaccuticals) or biomass. The method allows early (including pre-natal) diagnosis, and since samples can be sterilised is safe to perform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine, eye disease, conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; gential disease, pertihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; preumopathy; venereal lymphogranulomatosis; 88.

comprises hybridizing triple drug development and diagnosing cancer, comprises hyk forming oligonucleotide and probe to target sequence.

Example 2; Page 66; 141pp; English.

reverse phase triplex forming oligonucleotide, RP-TFO, (3' to the SNP) the target SNP used to analyse Factor V Leiden SNP using the method of the invention. The invention relates to analysing target nucleic acid sequences comprising restricting isolated DNA, hybridising at least one triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to form a protected nucleic acid sequence (FNAS) tail structure, hybridising the captured structure with a single nucleotide polymorphisms (SNP) identification probe and determining the SNP score. The methods can be sequences, to determine if they contain SNPs or short tandem repeats (STRS). The methods can be used for analysing target nucleic acid sequences, especially genomic DNA sequences, to determine if they contain SNPs or short tandem repeats (STRS). The methods can be used to detect SNPs for use in population genetics, drug development, forensics, cancer, genetic disease research, genomic analysis, diagnostics and therapeutics in humans, plants and sequence is a polypyrimidine oligonucleotide for binding a animals

New BAP28 polynucleotides and polypeptides overexpressed in prostate cancer cells for diagnosing prostate tumors, e.g. by hybridization or polymerase chain reaction assays.

Example; Page 347; 349pp; English.

The invention is directed to BAP28 polypeptides, BAP28 polynucleotide sequences and regulatory region located at the 3' and 5' ends of the BAP28 coding region. The BAP28 polypeptides can be expressed by standard recombinant methodology. BAP28 polynucleotides and polypeptides have been found to be over expressed in prostate tumour cells, therefore levels of

BAP28 expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR)) to diagnose patient suffering from or susceptible to prostate cancer. Antibodies specific for the BAP28 polypeptides are useful as diagnostic reagents. Biallelic markers of the BAP28 gene are useful in genetic analysis. Sequences AAR83934-963 represent primers for the BAP28 gene and PCTA-1 gene (the coding strand of PCTA-1 gene is on the opposite of the coding strand of BAP28) 88888888888

New antisense oligonucleotides targeted to nucleic acid encoding Protein Phosphatase 2 catalytic subunit beta, useful for treating diseases Phosphatase 2 catalytic subunit beta, useful for treating diseases related to Protein Phosphatase 2 catalytic subunit beta expression, such cancer aB

Example 16; Page 98; 137pp; English.

The invention relates to a novel compound 8-50 nucleotides in length targeted to a nucleic acid molecule encoding a protein phosphatase 2 catalytic beta subunit, where the compound specifically hybridises with an inhibite the expression of protein phosphatase 2 catalytic beta subunits, or specifically hybridises with at least an 8-nucleotide portain of an active site on a nucleic acid molecule encoding a protein phosphatase 2 catalytic beta subunit. The antisense compounds are useful for modulating the expression of protein phosphatase 2 catalytic beta subunits and for tracting diseases or conditions associated with expression of protein phosphatase 2 catalytic beta subunits, e.g. aberrant insulin regulation or diabetes or a hyperproliferative disorder, particularly cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and indistinguishing between functions of various members of a biological pathway. This polynucleotide sequence represents an oligonucleotide inhibitor of rat protein phosphatase 2 catalytic beta

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Claim 15; SEQ ID NO 911; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or and 3' intron-exon junctions, 5' or 3' end genomic flanking regions, 5' or and 3' intron-exon junctions of zegions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antishammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, stissue, or treating bronchoconstriction, lung ainflammatton, lung allergiae, or a respiratory disease or condition. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone 

Disclosure; SEQ ID NO 4420; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, c' initiation codon, coding regions, 5' or 3' end genomic flanking regions, c' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal alrway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, indo or mallignant disease or condition, also antiinflammatory steroid in a subject, for reducing or depleting levels of for enhancing the prophylactic or therapeutic respiratory effect of an antismanatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of demosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject is tissue, or a respiratory disease or condition. Unug allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed

comparising oligonucleotides, effective for alleviating contribution describes and bronchoconstriction, respiratory tract inflammation allergies and bronchoconstriction, respiratory tract inflammation allergies and bronchoconstriction or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating capression of a target polypeptide associated with lung alrawy or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antisathmatic, instructions density, immunosuppressive and cytostatic activity, is a halfage of the composition is useful for preventing or treating a respiratory, lung or mailgnant disease. The administered composition composition may administered to reduce the production

or availability, or to increase the degradation of the target mRNA or to pulmonary obstruction, and/or bronchoconstriction and/or lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhintis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic fibritis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted uncleic acids associated with lung airway or lung dysfunction, and

congrated depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery containers, (b) the oligonucleotides, (c) evice, in separate containers, (b) the oligonucleotides, (c) enstructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition confiction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung confiction and separate or conditions and/or bronchoconstriction, and separate or conditions and as a such as pulmonary disease, pulmonary confictions, palm, cystic fibrosis, allergic rhinitis, pulmonary configuration rejection, pulmonary infections, bronchiis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system environment and thereby, to prevent any unwanted effects due to it ö Human, antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; anniallergic, antiinflammatory; antisathmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic fibritis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer. This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating by threation, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that compositions of the invention also describes a kit, that composition of the invention as antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the production of treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary viseconstriction, and seems of inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary disease, pulmonary contained adenosine content of the anti-sense oligos corresponding to the inflammation rejection, pulmonary infections, brank, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                      Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                             invention describes a novel composition (a)

a first active agent,

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each 'Detag gene, 'Detagn's or converse again, 'Detagn's or and diagnosing and treating T-cell associated diseases concluming autoimmune diseases, 'degenerative nervous system diseases, 'Grarophing autoimmune diseases, 'Hypersensitivity diseases, infectious disease, and neoplastic disease. Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple carrophic gastritis. Degenerative nervous system diseases include multiple callergies, Type II hypersensitivities such as those present in Coodpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candid, parasitic infections such as those caused by the yeast genus Candid, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by shitted and bacterial infections such as those caused by who batterium hopping and hyphoproliferative diseases such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence. Disclosure; SEQ ID NO 849; 164pp; English. lymphomas and cancers such as leukaemias,

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) co-
cegniated chemokine-1 (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues compound, a method of inhibiting the calls or tissues with the antisense compound and a method of treating a human having a disease or condition associated with VCC-1 comprising or tissues with the antisense compound and a method of treating a human comprise at least one modified comprises at least one modified comprises at least one modified comprises at least one modified sugar moiety, preferably a 2'-0-
comprises at least one modified sugar moiety, preferably a 2'-0-
methoxyethyl sugar moiety, and at least one modified nucleobase,
comprises at least one condition associated with VCC-1, such as diabetes,
a chimeric oligonucleotide. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense oligonucleotide for condition associated with VCC-1, such as diabetes,
an immunological disorder, a cardiovascular disorder, a neurological
disorder, ischaemia, reperfusion injury, cancer or an angiogenic
confusorder, e-g. haemangiona, tumour angiogenseis, rheumatoid arthritis,
atherosclerosis, psoriasis or fibrosis after myocardial infarction. VCC-1
antisense oligonucleotides may also be used for wound healing, for treatment of this sequence represents an antisense
corresponder, e-g. humour angiodenseis, rheumangion, for treatment of lung or liver fibrosis or for cregeneration, for treatment of lung or liver fibrosis or for management of atrial fibrillarion. This sequence represents an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide of
tumour angiogenesis; rheumatoid arthritis; atherosclerosis; psoriasis; fibrosis; myocardial infarction; wound healing; bone fracture; cartilage damage; tissue regeneration; organ regeneration; periodontal disease; gut regeneration; atrial fibrillation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compounds targeted to a nucleic acid molecule encoding vascular endothelial growth factor co-regulated chemokine-1 (VCC-1), useful for treating VCC-1-associated disorders, e.g. diabetes or a neurologic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP, 9 A, 1 C, 2 G, 8 T, 0 U, 0 Other;

Claim 4; SEQ ID NO 616; 132pp; English.

antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiarmatory, neuroprotective, nootropic, antidarthitic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9d34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibite its expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MPGES-1 chimeric antisense oligonucleotides and anishense compounds have cytostatic, ophthalmic, immunological, cardiovascular or neurological disorder.

Sequence 20 BP; 1 A; 1 C; 2 G; 16 T; 0 U; 0 Other;

```
The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and cast exemining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or concerned pML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a diseases and for prediagnosis of such diseases. especially prion diseases concerned diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperhermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, comparation for prediagnosis of such diseases that encode milk proteins, particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion comparising a polymorphic microsatellite locus.

The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or protein activity of a cancer-related transmembrane protein (CRTP) or gene; an antibody specific for a CRTP, or a T cell activated by a CRTP; and C(b) a carrier. The pharmaceutical composition may also comprise a polynucleotide capable of inhibiting or decreasing the expression of the CRTP practice or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, CZOORTION, CCRONID, CDHG, CST, ENPP3, CT-11856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The CRTPs of the pharmaceutical composition is useful for treating cancer, e.g. colon cancer, lung cancer, neast cancer, liver cancer, kidney cancer, stomach cancer, and sephageal cancer. The present sequence is a target oligonucleotide from one such CRTP for which short interfering cancer, stomach directly from who are produced. Note: The sequence data for this patent did cont form part of the printed specification, but was obtained in electronic format directly from WIDD at

                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises antisense oligonucleotides that are targeted to nucleic acid molecules encoding human signal transducers and activators of transcription 3 (STAT3). The antisense oligonucleotides of the invention inhibit expression of human STAT3. The antisense of the oligonucleotides of the invention are useful for treating and preventing inflammatory diseases (e.g. rheumatoid arthritis) and cancers (e.g. and lymphomas). The present DNA sequence represents a human STAT3-specific antisense oligonucleotide. NOTE: The present sequence has a phosphorothioate backbone, 2'-MOE wings and a deoxy gap.
                                                                                                                                                                                                                                                                                                                                  New antisense compound, useful for treating or preventing inflammatory diseases (e.g. rheumatoid arthritis) and cancers (breast, prostate, head and neck, and brain cancer, myelomas, melanomas, leukemias, and

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets. e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PD field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                    tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor -indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes
                                                                                                                                                                                                                 Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors
                                                                                                                                                                                                                                                                                                         The present invention describes a method of producing binary sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

                                                                                                                           The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offest adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor -indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for providing a profile of mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes having a role in various cellular processes. The method is useful for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various
                   sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comparing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Providing mRNA profile, by generating two independent patterns
characteristic of sample mRNA population, analyzing patterns, comparing
gene expression by cell types under varied conditions, and identifying

The invention relates to determining the presence of and/or identifying a present in a sample. The method involves assigning to gene fragments gene candidates within a database by comparing signals in the database with the database comprising data representing mRNAs with known colly sites and/or 'virtual genes' representing a possible polya sites and/or 'virtual genes' representing a possible polyadenylation site within an actual gene. The method is useful for determining the presence of and/or identifying a polyadenylation site or alternative polyadenylation sites within a sequence of a transcribed gene or sequences of transcribed gene variants present or potentially present in a sample, in identifying gene variants present or potentially present in a sample, in identifying gene variants that occur in a population of nucleic acid molecules, especially in identifying or discovering polya internative polya site usage or determining poly site usage or determining poly site usage or determining poly site usage in a nucleic acid sample, and gene variants arising from alternative polya sites. The present sequence
                                                                                                                                                                                                  ö
cellular processes, including susceptibility to external factors, development, and disease. The present sequence for a PCR primer is used in the production of a single pattern characteristic of a sample, employing a Type II restriction enzyme (i.e. HaeII) in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present in a sample comprises assigning to gene fragments gene candidates within a database by comparing signals in the dataset with the database.

Producing a population of double-stranded product DNA molecules, useful for mRNA profiling, comprises amplification by nested polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to producing a population of double-stranded product DNA molecules comprising amplification by a nested PCR method. The method is useful in profiling mRNA transcribed in a system under investigation. The oligonucleotides are used as size standards in electrophoresis, and as internal controls allowing for calculation of relative amounts of material present. The present sequence represents adouble stranded product DNA, which aids in outlining an approach to production of a single pattern characteristic of a sample, employing a type II restriction enzyme (HaeII)
                                                                                                                                                                                                               Nucleic acid manipulation; mRNA profiling; polymerase chain reaction; electrophoresis; type II restriction enzyme; HaeII; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, itssue explants or organisms by introduction of MAPK genes in cells, itssue explants or organisms by introduction of SINA; (2) kits for in vitro or in vivo delivery of SINA; (3) conjugates and/or complexes of SINA; and (4) vectors that express SINA and cells containing these vectors. MAPK SINAs have cytostatic, anorectic, antidabetic, antiminamatory, antiathmatic, immunosuppressive, antibacterial, antirheumatic, antipachatic and gastrointestinal activities. The MAPK SINAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I complete the activities, and inflammatory diabetes types in cells, theumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; pharmacogenomics; containing intention entities that the containing subarmacogenomics; containing containing that the containing special containing cont

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated diagnosis of cancer, or protein kinase genes.

Example 3; SEQ ID NO 326; 164pp; English.

that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antibacterial, antihalammatory, antiasthmatic, immunosuppressive, antibacterial, antihalammatory, antiasthratic, in antipaciatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, disease). They can also be used for drug screening; diagnosis; target disease). They can also be used for drug screening; pharmacogenomics; check, theumatoria shorts genetic engineering; pharmacogenomics; chicklication and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention. The present invention describes a short interfering nucleic acid (siNA)

```
The invention relates to a chemically synthesized double stranded short interfering nucleic acid (siNA) molecule (I) that directs cleavage of a c-JUN RNA through RNA interference (RNA), where one strand of the siNA molecule comprises nucleotide sequence having sufficient complementarity to the c-JUN RNA for the siNA molecule to direct cleavage of the c-JUN RNA through RNA interference. (I) is useful for inhibiting mitogen activated protein kinase gene (e.g., c-JUN, JNK1, JNK2, JNS, BRK1 or BKK2) expression associated with diseases e.g., inflammatory disease, autoimmune disease, allorgy, cancer. (I) exhibits improved RNA interference activity and nuclease resistance. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mitogen activated protein kinase gene expression e.g., c-JUN associated with diseases e.g., inflammatory disease or autoimmune disease.
                                                           RNA interference; mitogen activated protein kinase inhibitor; inflammation; immunosuppressive; immune disorder; autoimmune disease; allergy; antiallergic; cytostatic; neoplasm; cancer; ss; siRNA; gene silencing; small interfering RNA; MAP kinase inhibitor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a chemically synthesized double stranded short interfering nucleic acid (siNA) molecule (1) that directe cleavage of a c-JUN RNA through RNA interference (RNA), where one strand of the siNA molecule comprises nucleotide sequence having sufficient complementarity to the c-JUN RNA for the siNA molecule to direct cleavage of the c-JUN RNA through RNA interference. (1) is useful for inhibiting mitogen activated protein kinase gene (e.g., c-JUN, JNK1, JNK2, p38, ERK1 or succious associated with diseases e.g., inflammacrory disease, autoimmune disease, allergy, cancer. (1) exhibits improved RNA interference activity and nuclease resistance. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel short interfering nucleic acid molecule useful for inhibiting mitogen activated protein kinase gene expression e.g., c-JUN associated with diseases e.g., inflammatory disease or autoimmune disease.
                                                                                                                                                                                                                           RNA interference; mitogen activated protein kinase inhibitor; inflammation; immunosuppressive; immune disorder; autoimmune disease; allergy; antiallergic; cytostatic; neoplasm; cancer; ss; siRNA; gene silencing; small interfering RNA; MAP kinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mcswiggen J, Beigelman L, Usman N, Haeberli P, Chowrira B;
